## Problems 11

Course of the function II (convexity/concavity, asymptotes)
Examine the course of the function, i.e. find its domain, intercepts with axes, limits at the endpoints of $D_{f}$, the derivative of the function and its zero points, local and global extrema, intervals of monotony, intervals of convexity/concavity, asymptotes, draw the graph. Justify everything properly.

Problems 1. -15 . are the same as in the sheet "Problems 10 ", just the questions of asymptotes and convexity/concavity are added (unless stated otherwise: solve problems with an asterisk ( $*$ ) without convexity/concavity).
