Part I

Definable cardinality

I. Definable cardinality

Introduction

According to the usual notion of cardinality, one set is smaller than another iff there is an injection of the former into the latter.

I. Definable cardinality

Introduction

According to the usual notion of cardinality, one set is smaller than another iff there is an injection of the former into the latter.

Much recent work in descriptive set theory has involved the analogous notion in which the injections are required to be definable.

I. Definable cardinality

Introduction

According to the usual notion of cardinality, one set is smaller than another iff there is an injection of the former into the latter.

Much recent work in descriptive set theory has involved the analogous notion in which the injections are required to be definable.

In this first lecture, we will review some of the basic theory behind these developments.

I. Definable cardinality

Polish spaces

Definition

A topological space is **Polish** if it is separable and admits a compatible complete metric.

I. Definable cardinality

Polish spaces

Definition

A topological space is **Polish** if it is separable and admits a compatible complete metric.

Definition

A subspace of a topological space is **Borel** if it is in the σ -algebra generated by the underlying topology.

I. Definable cardinality

Polish spaces

Definition

A topological space is **Polish** if it is separable and admits a compatible complete metric.

Definition

A subspace of a topological space is **Borel** if it is in the σ -algebra generated by the underlying topology.

Theorem 1

Every uncountable Polish space is Borel isomorphic to \mathbb{R} .

I. Definable cardinality

Polish spaces

Under determinacy, many properties of Borel sets in Polish spaces generalize to broader families of definable sets.

I. Definable cardinality

Polish spaces

Under determinacy, many properties of Borel sets in Polish spaces generalize to broader families of definable sets.

For simplicity, however, we will focus on Borel sets.

I. Definable cardinality

Morphisms

Definition

A **homomorphism** from E to F is a function $\varphi: X \rightarrow Y$ sending E -related points to F -related points.

I. Definable cardinality

Morphisms

Definition

A **homomorphism** from E to F is a function $\varphi: X \rightarrow Y$ sending E -related points to F -related points.

Definition

A **reduction** of E to F is a homomorphism from E to F sending E -unrelated points to F -unrelated points.

I. Definable cardinality

The definable analog of the continuum hypothesis

Theorem 2 (Silver)

Suppose that X is a Polish space and E is a Borel equivalence relation on X . Then exactly one of the following holds:

- 1 There is a Borel reduction of E to the equality relation on \mathbb{N} .
- 2 There is a Borel reduction of the equality relation on \mathbb{R} to E .

I. Definable cardinality

The definable analog of the next continuum hypothesis

Definition

The Vitali equivalence relation is the relation $E_{\mathbb{Q}}$ on \mathbb{R} given by

$$x E_{\mathbb{Q}} y \Leftrightarrow x - y \in \mathbb{Q}.$$

I. Definable cardinality

The definable analog of the next continuum hypothesis

Definition

The **Vitali equivalence relation** is the relation $E_{\mathbb{Q}}$ on \mathbb{R} given by

$$x E_{\mathbb{Q}} y \Leftrightarrow x - y \in \mathbb{Q}.$$

Theorem 3 (Harrington-Kechris-Louveau)

Suppose that X is a Polish space and E is a Borel equivalence relation on X . Then exactly one of the following holds:

- 1 There is a Borel reduction of E to the equality relation on \mathbb{R} .
- 2 There is a Borel reduction of $E_{\mathbb{Q}}$ to E .

I. Definable cardinality

Beyond Vitali equivalence

Definition

An equivalence relation is **countable** if its classes are all countable.

I. Definable cardinality

Beyond Vitali equivalence

Definition

An equivalence relation is **countable** if its classes are all countable.

Theorem 4 (Sullivan-Weiss-Wright, Woodin, Kechris-Hjorth)

Every countable Borel equivalence relation on a Polish space admits a Baire measurable reduction to the Vitali equivalence relation.

I. Definable cardinality

Beyond Vitali equivalence

Definition

An equivalence relation is **countable** if its classes are all countable.

Theorem 4 (Sullivan-Weiss-Wright, Woodin, Kechris-Hjorth)

Every countable Borel equivalence relation on a Polish space admits a Baire measurable reduction to the Vitali equivalence relation.

I. Definable cardinality

Beyond Vitali equivalence

Definition

The orbit equivalence relation associated with a group action $\Gamma \curvearrowright X$ is the relation E_Γ^X on X given by $x E_\Gamma^X y \Leftrightarrow \exists \gamma \in \Gamma \gamma \cdot x = y$.

I. Definable cardinality

Beyond Vitali equivalence

Definition

The orbit equivalence relation associated with a group action $\Gamma \curvearrowright X$ is the relation E_Γ^X on X given by $x E_\Gamma^X y \Leftrightarrow \exists \gamma \in \Gamma \gamma \cdot x = y$.

Definition

A measure μ is Γ -invariant if $\forall B \subseteq X \forall \gamma \in \Gamma \mu(B) = \mu(\gamma(B))$.

I. Definable cardinality

Beyond Vitali equivalence

Theorem 5 (Ornstein-Weiss)

Suppose that X is a Polish space, $\Gamma \curvearrowright X$ is a free Borel action of a countable group, and μ is a Γ -invariant Borel probability measure on X . Then Γ is amenable iff E_Γ^X is μ -hyperfinite.

I. Definable cardinality

Beyond Vitali equivalence

Theorem 5 (Ornstein-Weiss)

Suppose that X is a Polish space, $\Gamma \curvearrowright X$ is a free Borel action of a countable group, and μ is a Γ -invariant Borel probability measure on X . Then Γ is amenable iff E_Γ^X is μ -hyperfinite.

Question

Suppose that X is a Polish space and E is a countable Borel equivalence relation on X which is not Borel reducible to the Vitali equivalence relation. Is there a Borel probability measure μ on X for which there is no μ -measurable reduction?

I. Definable cardinality

Global structure

Theorem 6 (Woodin, Louveau-Velickovic)

There is a family of uncountably many Borel equivalence relations on Polish spaces which are pairwise incomparable under Baire measurable (and therefore Borel) reducibility.

I. Definable cardinality

Global structure

Theorem 7 (Adams-Kechris)

There is a family of continuum-many countable Borel equivalence relations on Polish spaces which are pairwise incomparable under Borel reducibility.

I. Definable cardinality

Global structure

Theorem 7 (Adams-Kechris)

There is a family of continuum-many countable Borel equivalence relations on Polish spaces which are pairwise incomparable under Borel reducibility.

Theorem 8 (Adams-Kechris, Gao)

There is a Borel reduction of every analytic quasi-order on a Polish space into (codes for) the Borel reducibility quasi-order on the space of countable Borel equivalence relations.

I. Definable cardinality

Global structure

Definition

A Borel equivalence relation E is **treeable** if there is an acyclic Borel graph whose connected components are exactly the classes of E .

I. Definable cardinality

Global structure

Definition

A Borel equivalence relation E is **treeable** if there is an acyclic Borel graph whose connected components are exactly the classes of E .

Theorem 9 (Hjorth)

There is a family of continuum-many countable Borel equivalence relations on Polish spaces which are pairwise incomparable under Borel reducibility.

I. Definable cardinality

Pathology

Theorem 10 (Thomas)

There is a countable Borel equivalence relation E on a Polish space with the property that the disjoint union of two copies of E is not Borel reducible to E .

I. Definable cardinality

Pathology

Theorem 10 (Thomas)

There is a countable Borel equivalence relation E on a Polish space with the property that the disjoint union of two copies of E is not Borel reducible to E .

Theorem 11 (Adams, Hjorth)

There are countable treeable Borel equivalence relations $E \subseteq F$ on a Polish space which are incomparable under Borel reducibility.

I. Definable cardinality

Method

Lurking beneath the results for countable Borel equivalence relations are sophisticated rigidity theorems originating in the ergodic-theoretic study of actions of linear algebraic groups.

I. Definable cardinality

Method

Lurking beneath the results for countable Borel equivalence relations are sophisticated rigidity theorems originating in the ergodic-theoretic study of actions of linear algebraic groups.

In the remaining lectures, we will sketch significantly simpler proofs of strengthenings of many of these results.

I. Definable cardinality

Method

We will first establish a simple purely Borel rigidity theorem.

I. Definable cardinality

Method

We will first establish a simple purely Borel rigidity theorem.

From this, we will obtain separability of certain spaces of measurable homomorphisms connected with equivalence relations.

I. Definable cardinality

Method

We will first establish a simple purely Borel rigidity theorem.

From this, we will obtain separability of certain spaces of measurable homomorphisms connected with equivalence relations.

Finally, we will use this separability to establish the main results.

Definable cardinals just beyond \mathbb{R}/\mathbb{Q}

Part I

Local rigidity

I. Local rigidity

Basic definitions

Definition

The **difference set** associated with functions $\varphi: X \rightarrow Y$ and $\psi: X \rightarrow Y$ is the set $D(\varphi, \psi)$ given by

$$D(\varphi, \psi) = \{x \in X \mid \varphi(x) \neq \psi(x)\}.$$

I. Local rigidity

Basic definitions

Definition

The **difference set** associated with functions $\varphi: X \rightarrow Y$ and $\psi: X \rightarrow Y$ is the set $D(\varphi, \psi)$ given by

$$D(\varphi, \psi) = \{x \in X \mid \varphi(x) \neq \psi(x)\}.$$

Definition

Given $\Gamma \curvearrowright Y$, we say that a homomorphism $\varphi: X \rightarrow Y$ from E to E_Γ^Y is **ρ -invariant** if $\varphi(x_1) = \rho(x_1, x_2) \cdot \varphi(x_2)$ for all $x_1, x_2 \in X$.

I. Local rigidity

Basic definitions

Definition

We say that $\Gamma \curvearrowright Y$ is **locally rigid** if whenever X is a Polish space, E is a countable Borel equivalence relation on X , $\rho: E \rightarrow \Gamma$ is a Borel function, and φ, ψ are ρ -invariant countable-to-one Borel homomorphisms from E to E_Γ^Y , the equivalence relation $E \upharpoonright D(\varphi, \psi)$ is Borel reducible to $E_{\mathbb{Q}}$.

I. Local rigidity

Basic definitions

Definition

We say that $\Gamma \curvearrowright Y$ is **locally rigid** if whenever X is a Polish space, E is a countable Borel equivalence relation on X , $\rho: E \rightarrow \Gamma$ is a Borel function, and φ, ψ are ρ -invariant countable-to-one Borel homomorphisms from E to E_Γ^Y , the equivalence relation $E \upharpoonright D(\varphi, \psi)$ is Borel reducible to $E_{\mathbb{Q}}$.

Today we will prove that $\mathbb{Z}^2 \rtimes \mathrm{SL}_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ is locally rigid.

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Definition

An equivalence relation is **finite** if its classes are all finite.

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Definition

An equivalence relation is **finite** if its classes are all finite.

Definition

A Borel equivalence relation E is **hyperfinite** if there are finite Borel subequivalence relations $F_0 \subseteq F_1 \subseteq \dots$ such that $E = \bigcup_{n \in \mathbb{N}} F_n$.

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Definition

A Borel equivalence relation is **smooth** if it is Borel reducible to the equality relation on \mathbb{R} .

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Definition

A Borel equivalence relation is **smooth** if it is Borel reducible to the equality relation on \mathbb{R} .

Definition

A Borel equivalence relation is **hypersmooth** if there are smooth Borel equivalence relations $F_0 \subseteq F_1 \subseteq \dots$ such that $E = \bigcup_{n \in \mathbb{N}} F_n$.

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Theorem 1 (Dougherty-Jackson-Kechris, Slaman-Steel, Weiss)

Suppose that X is a Polish space and E is a countable Borel equivalence relation on X . Then the following are equivalent:

- 1 There is a Borel reduction of E to $E_{\mathbb{Q}}$.
- 2 The equivalence relation E is hyperfinite.
- 3 The equivalence relation E is hypersmooth.
- 4 There is a Borel action $\mathbb{Z} \curvearrowright X$ such that $E = E_{\mathbb{Z}}^X$.

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Theorem 1 (Dougherty-Jackson-Kechris, Slaman-Steel, Weiss)

Suppose that X is a Polish space and E is a countable Borel equivalence relation on X . Then the following are equivalent:

- 1 There is a Borel reduction of E to $E_{\mathbb{Q}}$.
- 2 The equivalence relation E is hyperfinite.
- 3 The equivalence relation E is hypersmooth.
- 4 There is a Borel action $\mathbb{Z} \curvearrowright X$ such that $E = E_{\mathbb{Z}}^X$.

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Proposition 2 (Dougherty-Jackson-Kechris)

Suppose that X is a Polish space and E is a Borel equivalence relation on X . Then the family of Borel sets on which E is hyperfinite is closed under countable unions.

I. Local rigidity

Robustness of \mathbb{R}/\mathbb{Q}

Proposition 2 (Dougherty-Jackson-Kechris)

Suppose that X is a Polish space and E is a Borel equivalence relation on X . Then the family of Borel sets on which E is hyperfinite is closed under countable unions.

Proposition 3 (Dougherty-Jackson-Kechris)

Suppose that X and Y are Polish spaces, E and F are countable Borel equivalence relations, F is hyperfinite, and there is a countable-to-one Borel homomorphism from E to F . Then E is hyperfinite.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Definition

We identify \mathbb{T} with the set of rays through \mathbb{R}^2 rooted at the origin.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Definition

We identify \mathbb{T} with the set of rays through \mathbb{R}^2 rooted at the origin.

Definition

Let $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ denote the action induced by $SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 4 (Jackson-Kechris-Louveau)

There is a Borel reduction of $E_{SL_2(\mathbb{Z})}^{\mathbb{T}}$ to $E_{\mathbb{Q}}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 5 (Conley-M)

Only countably many points of \mathbb{T} have non-trivial stabilizers under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$, and they are all infinite cyclic.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 5 (Conley-M)

Only countably many points of \mathbb{T} have non-trivial stabilizers under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$, and they are all infinite cyclic.

Proof

Suppose that $\theta \in \mathbb{T}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 5 (Conley-M)

Only countably many points of \mathbb{T} have non-trivial stabilizers under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$, and they are all infinite cyclic.

Proof

Suppose that $\theta \in \mathbb{T}$.

There are now two cases, depending on whether $\theta \cap \mathbb{Z}^2 \neq \emptyset$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Suppose first that the set $\theta \cap \mathbb{Z}^2$ is non-empty.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Suppose first that the set $\theta \cap \mathbb{Z}^2$ is non-empty.

Let $v = (v_1, v_2)$ be the element of this set of minimal magnitude.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Suppose first that the set $\theta \cap \mathbb{Z}^2$ is non-empty.

Let $v = (v_1, v_2)$ be the element of this set of minimal magnitude.

Suppose that A is in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Suppose first that the set $\theta \cap \mathbb{Z}^2$ is non-empty.

Let $v = (v_1, v_2)$ be the element of this set of minimal magnitude.

Suppose that A is in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$.

Then $Av = \lambda v$ for some $\lambda > 0$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Suppose first that the set $\theta \cap \mathbb{Z}^2$ is non-empty.

Let $v = (v_1, v_2)$ be the element of this set of minimal magnitude.

Suppose that A is in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$.

Then $Av = \lambda v$ for some $\lambda > 0$.

Minimality ensures that $\lambda = 1$, thus the stabilizers of θ and v under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ and $SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ are one and the same.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Minimality also ensures that v_1 and v_2 are relatively prime.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Minimality also ensures that v_1 and v_2 are relatively prime.

So there exists $a \in \mathbb{Z}^2$ such that $a \cdot v = 1$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Minimality also ensures that v_1 and v_2 are relatively prime.

So there exists $a \in \mathbb{Z}^2$ such that $a \cdot v = 1$.

$$\text{Set } B = \begin{bmatrix} a_1 & a_2 \\ -v_1 & v_2 \end{bmatrix}.$$

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Minimality also ensures that v_1 and v_2 are relatively prime.

So there exists $a \in \mathbb{Z}^2$ such that $a \cdot v = 1$.

$$\text{Set } B = \begin{bmatrix} a_1 & a_2 \\ -v_1 & v_2 \end{bmatrix}.$$

Then $B \in SL_2(\mathbb{Z})$ and $Bv = (1, 0)$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Minimality also ensures that v_1 and v_2 are relatively prime.

So there exists $a \in \mathbb{Z}^2$ such that $a \cdot v = 1$.

$$\text{Set } B = \begin{bmatrix} a_1 & a_2 \\ -v_1 & v_2 \end{bmatrix}.$$

Then $B \in SL_2(\mathbb{Z})$ and $Bv = (1, 0)$.

So conjugation by B yields an isomorphism of the stabilizer of v under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ with that of $(1, 0)$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

The latter consists of the upper unitriangular matrices in $SL_2(\mathbb{Z})$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

The latter consists of the upper unitriangular matrices in $SL_2(\mathbb{Z})$.

And this group is trivially infinite cyclic.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

We now handle the case that $\theta \cap \mathbb{Z}^2$ is empty.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

We now handle the case that $\theta \cap \mathbb{Z}^2$ is empty.

Fix any $v \in \theta$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

We now handle the case that $\theta \cap \mathbb{Z}^2$ is empty.

Fix any $v \in \theta$.

Then v_1 and v_2 are independent over \mathbb{Q} .

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

We now handle the case that $\theta \cap \mathbb{Z}^2$ is empty.

Fix any $v \in \theta$.

Then v_1 and v_2 are independent over \mathbb{Q} .

So the stabilizer of v under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ is trivial.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

We now handle the case that $\theta \cap \mathbb{Z}^2$ is empty.

Fix any $v \in \theta$.

Then v_1 and v_2 are independent over \mathbb{Q} .

So the stabilizer of v under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ is trivial.

Let Λ denote the set of eigenvalues of matrices fixing θ .

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Lemma 6

The group Λ is cyclic.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Lemma 6

The group Λ is cyclic.

Proof

We need only show that Λ is not dense.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Lemma 6

The group Λ is cyclic.

Proof

We need only show that Λ is not dense.

Suppose that v is an eigenvalue of $A \in SL_2(\mathbb{Z})$ with eigenvalue λ .

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Lemma 6

The group Λ is cyclic.

Proof

We need only show that Λ is not dense.

Suppose that v is an eigenvalue of $A \in SL_2(\mathbb{Z})$ with eigenvalue λ .

Let μ denote the other eigenvalue.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Lemma 6 (continued)

Then $\lambda\mu = \det(A) = 1$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Lemma 6 (continued)

Then $\lambda\mu = \det(A) = 1$.

So $\text{trace}(A) = \lambda + \mu = \lambda + 1/\lambda$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Lemma 6 (continued)

Then $\lambda\mu = \det(A) = 1$.

So $\text{trace}(A) = \lambda + \mu = \lambda + 1/\lambda$.

Thus $\lambda + 1/\lambda \in \mathbb{Z}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Lemma 6 (continued)

Then $\lambda\mu = \det(A) = 1$.

So $\text{trace}(A) = \lambda + \mu = \lambda + 1/\lambda$.

Thus $\lambda + 1/\lambda \in \mathbb{Z}$.

And the set of such λ cannot be dense.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Fix A in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ whose corresponding eigenvalue λ generates Λ .

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Fix A in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ whose corresponding eigenvalue λ generates Λ .

If B is also in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$, then the corresponding eigenvalue is λ^n , for some $n \in \mathbb{Z}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Fix A in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ whose corresponding eigenvalue λ generates Λ .

If B is also in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$, then the corresponding eigenvalue is λ^n , for some $n \in \mathbb{Z}$.

So $A^n B^{-1}$ is the identity matrix, thus $B = A^n$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Fix A in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ whose corresponding eigenvalue λ generates Λ .

If B is also in the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$, then the corresponding eigenvalue is λ^n , for some $n \in \mathbb{Z}$.

So $A^n B^{-1}$ is the identity matrix, thus $B = A^n$.

Hence the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ is infinite cyclic.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Note that each non-trivial $A \in SL_2(\mathbb{Z})$ fixes at most two $\theta \in \mathbb{T}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 5 (continued)

Note that each non-trivial $A \in SL_2(\mathbb{Z})$ fixes at most two $\theta \in \mathbb{T}$.

As $SL_2(\mathbb{Z})$ is countable, it follows that only countably many $\theta \in \mathbb{T}$ have non-trivial stabilizers. ☒

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 7 (Conley-M)

Suppose that X is a Polish space and $SL_2(\mathbb{Z}) \curvearrowright X$ is Borel. Then there is a Borel reduction of $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X}$ to $E_{\mathbb{Q}}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 7 (Conley-M)

Suppose that X is a Polish space and $SL_2(\mathbb{Z}) \curvearrowright X$ is Borel. Then there is a Borel reduction of $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X}$ to $E_{\mathbb{Q}}$.

Proof

Let \mathbb{T}' denote the $SL_2(\mathbb{Z})$ -invariant Borel set consisting of all $\theta \in \mathbb{T}$ whose stabilizers under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ are trivial.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 7 (Conley-M)

Suppose that X is a Polish space and $SL_2(\mathbb{Z}) \curvearrowright X$ is Borel. Then there is a Borel reduction of $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X}$ to $E_{\mathbb{Q}}$.

Proof

Let \mathbb{T}' denote the $SL_2(\mathbb{Z})$ -invariant Borel set consisting of all $\theta \in \mathbb{T}$ whose stabilizers under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ are trivial.

Any Borel \mathbb{Z} -action generating $E_{SL_2(\mathbb{Z})}^{\mathbb{T}'}$ induces one for $E_{SL_2(\mathbb{Z})}^{\mathbb{T}' \times X}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 7 (Conley-M)

Suppose that X is a Polish space and $SL_2(\mathbb{Z}) \curvearrowright X$ is Borel. Then there is a Borel reduction of $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X}$ to $E_{\mathbb{Q}}$.

Proof

Let \mathbb{T}' denote the $SL_2(\mathbb{Z})$ -invariant Borel set consisting of all $\theta \in \mathbb{T}$ whose stabilizers under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$ are trivial.

Any Borel \mathbb{Z} -action generating $E_{SL_2(\mathbb{Z})}^{\mathbb{T}'}$ induces one for $E_{SL_2(\mathbb{Z})}^{\mathbb{T}' \times X}$.

So there is a Borel reduction of $E_{SL_2(\mathbb{Z})}^{\mathbb{T}' \times X}$ to $E_{\mathbb{Q}}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 7 (continued)

Suppose now that $\theta \in \mathbb{T} \setminus \mathbb{T}'$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 7 (continued)

Suppose now that $\theta \in \mathbb{T} \setminus \mathbb{T}'$.

Let Z denote the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 7 (continued)

Suppose now that $\theta \in \mathbb{T} \setminus \mathbb{T}'$.

Let Z denote the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$.

Then $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X} \upharpoonright (\{\theta\} \times X) = E_Z^{\mathbb{T} \times X} \upharpoonright (\{\theta\} \times X)$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 7 (continued)

Suppose now that $\theta \in \mathbb{T} \setminus \mathbb{T}'$.

Let Z denote the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$.

Then $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X} \upharpoonright (\{\theta\} \times X) = E_Z^{\mathbb{T} \times X} \upharpoonright (\{\theta\} \times X)$.

And the latter is Borel reducible to $E_{\mathbb{Q}}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 7 (continued)

Suppose now that $\theta \in \mathbb{T} \setminus \mathbb{T}'$.

Let Z denote the stabilizer of θ under $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$.

Then $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X} \upharpoonright (\{\theta\} \times X) = E_Z^{\mathbb{T} \times X} \upharpoonright (\{\theta\} \times X)$.

And the latter is Borel reducible to $E_{\mathbb{Q}}$.

So $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times X}$ is Borel reducible to $E_{\mathbb{Q}}$. ☒

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Definition

We identify \mathbb{T}^2 with $\mathbb{R}^2/\mathbb{Z}^2$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Definition

We identify \mathbb{T}^2 with $\mathbb{R}^2/\mathbb{Z}^2$.

Definition

Let $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}^2$ denote the action induced by $SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proposition 8 (Conley-M)

Suppose that X is a Polish space, E is a countable Borel equivalence relation on X , \mathcal{I} is a σ -ideal on X , $\rho: E \rightarrow \mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})$ is a Borel function, φ and ψ are ρ -invariant Borel homomorphisms from E to $E_{\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})}^{\mathbb{R}^2}$, and φ is \mathcal{I} -to-one. Then there is an \mathcal{I} -to-one Borel homomorphism from $E \upharpoonright D(\varphi, \psi)$ to $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times \mathbb{T}^2}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof

Define $\sigma: E \upharpoonright D(\varphi, \psi) \rightarrow SL_2(\mathbb{Z})$ by $\sigma(x, y) = \text{proj}_{SL_2(\mathbb{Z})} \circ \rho(x, y)$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof

Define $\sigma: E \upharpoonright D(\varphi, \psi) \rightarrow SL_2(\mathbb{Z})$ by $\sigma(x, y) = \text{proj}_{SL_2(\mathbb{Z})} \circ \rho(x, y)$.

Note that $\text{proj}_{\mathbb{T}^2} \circ \varphi(x) \upharpoonright D(\varphi, \psi)$ is σ -invariant.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof

Define $\sigma: E \upharpoonright D(\varphi, \psi) \rightarrow SL_2(\mathbb{Z})$ by $\sigma(x, y) = \text{proj}_{SL_2(\mathbb{Z})} \circ \rho(x, y)$.

Note that $\text{proj}_{\mathbb{T}^2} \circ \varphi(x) \upharpoonright D(\varphi, \psi)$ is σ -invariant.

Define $\pi: D(\varphi, \psi) \rightarrow \mathbb{T}$ by $\pi(x) = \text{proj}_{\mathbb{T}}(\varphi(x) - \psi(x))$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Lemma 9

The function π is σ -invariant.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Lemma 9

The function π is σ -invariant.

Proof

If $x_1, x_2 \in D(\varphi, \psi)$ are E -related, then

$$\begin{aligned}\pi(x_1) &= \text{proj}_{\mathbb{T}}(\varphi(x_1) - \psi(x_1)) \\ &= \text{proj}_{\mathbb{T}}(\rho(x_1, x_2) \cdot \varphi(x_2) - \rho(x_1, x_2) \cdot \psi(x_2)) \\ &= \text{proj}_{\mathbb{T}}(\sigma(x_1, x_2) \cdot \varphi(x_2) - \sigma(x_1, x_2) \cdot \psi(x_2)) \\ &= \text{proj}_{\mathbb{T}}(\sigma(x_1, x_2) \cdot (\varphi(x_2) - \psi(x_2))) \\ &= \sigma(x_1, x_2) \cdot \text{proj}_{\mathbb{T}}(\varphi(x_2) - \psi(x_2)) \\ &= \sigma(x_1, x_2) \cdot \pi(x_2),\end{aligned}$$

thus π is σ -invariant. 

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 8 (continued)

So both $\text{proj}_{\mathbb{T}^2} \circ \varphi \upharpoonright D(\varphi, \psi)$ and π are σ -invariant.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 8 (continued)

So both $\text{proj}_{\mathbb{T}^2} \circ \varphi \upharpoonright D(\varphi, \psi)$ and π are σ -invariant.

Thus their product is a homomorphism to $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times \mathbb{T}^2}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Proof of Proposition 8 (continued)

So both $\text{proj}_{\mathbb{T}^2} \circ \varphi \upharpoonright D(\varphi, \psi)$ and π are σ -invariant.

Thus their product is a homomorphism to $E_{SL_2(\mathbb{Z})}^{\mathbb{T} \times \mathbb{T}^2}$.

As φ is \mathcal{I} -to-one, so too is the product. ☒

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Theorem 10 (Conley-M)

The action $\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ is locally rigid.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Theorem 10 (Conley-M)

The action $\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ is locally rigid.

Proof

Suppose that X is a Polish space, E is a countable Borel equivalence relation on X , $\rho: E \rightarrow \mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})$ is Borel, and φ and ψ are countable-to-one Borel homomorphisms from E to $E_{\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})}^{\mathbb{R}^2}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Theorem 10 (Conley-M)

The action $\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ is locally rigid.

Proof

Suppose that X is a Polish space, E is a countable Borel equivalence relation on X , $\rho: E \rightarrow \mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})$ is Borel, and φ and ψ are countable-to-one Borel homomorphisms from E to $E_{\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})}^{\mathbb{R}^2}$.

It then follows that there is a countable-to-one Borel homomorphism from $E \upharpoonright D(\varphi, \psi)$ to $E_{\mathbb{Q}}$.

I. Local rigidity

The action $SL_2(\mathbb{Z}) \curvearrowright \mathbb{T}$

Theorem 10 (Conley-M)

The action $\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z}) \curvearrowright \mathbb{R}^2$ is locally rigid.

Proof

Suppose that X is a Polish space, E is a countable Borel equivalence relation on X , $\rho: E \rightarrow \mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})$ is Borel, and φ and ψ are countable-to-one Borel homomorphisms from E to $E_{\mathbb{Z}^2 \rtimes SL_2(\mathbb{Z})}^{\mathbb{R}^2}$.

It then follows that there is a countable-to-one Borel homomorphism from $E \upharpoonright D(\varphi, \psi)$ to $E_{\mathbb{Q}}$.

So $E \upharpoonright D(\varphi, \psi)$ is Borel reducible to $E_{\mathbb{Q}}$.

Part III

Separability

III. Separability

A function space

Definition

We use $L(X, \mu, Y)$ to denote the family of all μ -measurable functions $\varphi: D \rightarrow Y$ with μ -positive domains $D \subseteq X$.

III. Separability

A function space

Definition

We use $L(X, \mu, Y)$ to denote the family of all μ -measurable functions $\varphi: D \rightarrow Y$ with μ -positive domains $D \subseteq X$.

Definition

We view $L(X, \mu, Y)$ as a pseudo-metric space, equipped with the pseudo-metric d_μ given by $d_\mu(\varphi, \psi) = \mu(D(\varphi, \psi))$.

III. Separability

A function space

Proposition 1

Suppose that X and Y are Polish spaces, μ is a finite Borel measure on X , and $\mathcal{L} \subseteq L(X, \mu, Y)$. Then \mathcal{L} is separable iff there is a Borel set $R \subseteq X \times Y$, whose vertical sections are all countable, such that

$$\forall \varphi \in \mathcal{L} \quad \mu(\{x \in \text{dom}(\varphi) \mid \neg x R \varphi(x)\}) = 0.$$

III. Separability

A function space

Proposition 1

Suppose that X and Y are Polish spaces, μ is a finite Borel measure on X , and $\mathcal{L} \subseteq L(X, \mu, Y)$. Then \mathcal{L} is separable iff there is a Borel set $R \subseteq X \times Y$, whose vertical sections are all countable, such that

$$\forall \varphi \in \mathcal{L} \quad \mu(\{x \in \text{dom}(\varphi) \mid \neg x R \varphi(x)\}) = 0.$$

Proof

Suppose that $R \subseteq X \times Y$ is a Borel set, whose vertical sections are all countable, such that $\forall \varphi \in \mathcal{L} \quad \mu(\{x \in \text{dom}(\varphi) \mid \neg x R \varphi(x)\}) = 0$.

III. Separability

A function space

Proof of Proposition 1 (continued)

Fix a countable algebra \mathcal{A} of Borel subsets of X such that for all Borel sets $B \subseteq X$ and $\epsilon > 0$, there exists $A \in \mathcal{A}$ with $\mu(A \Delta B) \leq \epsilon$.

III. Separability

A function space

Proof of Proposition 1 (continued)

Fix a countable algebra \mathcal{A} of Borel subsets of X such that for all Borel sets $B \subseteq X$ and $\epsilon > 0$, there exists $A \in \mathcal{A}$ with $\mu(A \Delta B) \leq \epsilon$.

Fix a countable family \mathcal{F} of Borel functions $f: D \rightarrow Y$, with Borel domains $D \subseteq X$, such that $R = \bigcup_{f \in \mathcal{F}} \text{graph}(f)$.

III. Separability

A function space

Proof of Proposition 1 (continued)

Fix a countable algebra \mathcal{A} of Borel subsets of X such that for all Borel sets $B \subseteq X$ and $\epsilon > 0$, there exists $A \in \mathcal{A}$ with $\mu(A \Delta B) \leq \epsilon$.

Fix a countable family \mathcal{F} of Borel functions $f: D \rightarrow Y$, with Borel domains $D \subseteq X$, such that $R = \bigcup_{f \in \mathcal{F}} \text{graph}(f)$.

One obtains a dense set by considering $(f_1 \upharpoonright A_1) \cup \dots \cup (f_n \upharpoonright A_n)$, where $n \in \mathbb{N}$, $A_1, \dots, A_n \in \mathcal{A}$, and $f_1, \dots, f_n \in \mathcal{F}$. ☒

III. Separability

Closure

Proposition 2

Suppose that X , Y , and Z are Polish spaces, μ is a finite Borel measure on X , $\mathcal{L}_{XY} \subseteq L(X, \mu, Y)$, $\mathcal{L}_{XZ} \subseteq L(X, \mu, Z)$, there is a countable-to-one Borel function $f: Y \rightarrow Z$ with $f \circ \mathcal{L}_{XY} \subseteq \mathcal{L}_{XZ}$, and \mathcal{L}_{XZ} is separable. Then \mathcal{L}_{XY} is separable.

III. Separability

Closure

Proposition 2

Suppose that X , Y , and Z are Polish spaces, μ is a finite Borel measure on X , $\mathcal{L}_{XY} \subseteq L(X, \mu, Y)$, $\mathcal{L}_{XZ} \subseteq L(X, \mu, Z)$, there is a countable-to-one Borel function $f: Y \rightarrow Z$ with $f \circ \mathcal{L}_{XY} \subseteq \mathcal{L}_{XZ}$, and \mathcal{L}_{XZ} is separable. Then \mathcal{L}_{XY} is separable.

Proof

Fix a Borel set $S \subseteq Y \times Z$, whose vertical sections are all countable, such that $\forall \varphi \in \mathcal{L}_{XZ} \mu(\{x \in \text{dom}(\varphi) \mid \neg x S \varphi(x)\}) = 0$.

III. Separability

Closure

Proposition 2

Suppose that X , Y , and Z are Polish spaces, μ is a finite Borel measure on X , $\mathcal{L}_{XY} \subseteq L(X, \mu, Y)$, $\mathcal{L}_{XZ} \subseteq L(X, \mu, Z)$, there is a countable-to-one Borel function $f: Y \rightarrow Z$ with $f \circ \mathcal{L}_{XY} \subseteq \mathcal{L}_{XZ}$, and \mathcal{L}_{XZ} is separable. Then \mathcal{L}_{XY} is separable.

Proof

Fix a Borel set $S \subseteq Y \times Z$, whose vertical sections are all countable, such that $\forall \varphi \in \mathcal{L}_{XZ} \mu(\{x \in \text{dom}(\varphi) \mid \neg x S \varphi(x)\}) = 0$.

Set $R = \{(x, y) \in X \times Y \mid x S f(y)\}$.

III. Separability

Homomorphisms

Definition

Let $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ denote the set of countable-to-one homomorphisms $\varphi \in L(X, \mu, Y)$ from $E \upharpoonright \text{dom}(\varphi)$ to F .

III. Separability

Homomorphisms

Proposition 3

Suppose that X , Y , and Z are Polish spaces, E , F , and G are countable Borel equivalence relations on X , Y , and Z , μ is a finite Borel measure on X , there is a countable-to-one Borel homomorphism $\varphi: Y \rightarrow Z$ from F to G , and $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, G)$ is separable. Then $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ is separable.

III. Separability

Homomorphisms

Proposition 3

Suppose that X , Y , and Z are Polish spaces, E , F , and G are countable Borel equivalence relations on X , Y , and Z , μ is a finite Borel measure on X , there is a countable-to-one Borel homomorphism $\varphi: Y \rightarrow Z$ from F to G , and $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, G)$ is separable. Then $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ is separable.

Proof

By the previous proposition, it is clearly sufficient to observe that $\varphi \circ \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F) \subseteq \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, G)$. ☒

III. Separability

Local rigidity

Definition

We say that E is μ -nowhere hyperfinite if there is no μ -positive Borel set $B \subseteq X$ with the property that $E \upharpoonright B$ is hyperfinite.

III. Separability

Local rigidity

Proposition 4

Suppose that X and Y are Polish spaces, E and F are countable Borel equivalence relations on X and Y , μ is a finite Borel measure on X for which E is μ -nowhere hyperfinite, and F is the orbit equivalence relation of a locally rigid Borel action $\Gamma \curvearrowright Y$ of a countable group. Then $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ is separable.

III. Separability

Local rigidity

Proof

Fix real numbers $\epsilon_n > 0$ such that $\sum_{n \in \mathbb{N}} \epsilon_n < \infty$.

III. Separability

Local rigidity

Proof

Fix real numbers $\epsilon_n > 0$ such that $\sum_{n \in \mathbb{N}} \epsilon_n < \infty$.

Let μ_c denote the counting measure on X .

III. Separability

Local rigidity

Proof

Fix real numbers $\epsilon_n > 0$ such that $\sum_{n \in \mathbb{N}} \epsilon_n < \infty$.

Let μ_c denote the counting measure on X .

Fix an increasing sequence of Borel sets $R_n \subseteq X \times X$ such that $E = \bigcup_{n \in \mathbb{N}} R_n$ and each vertical section of R_n has cardinality $\leq n$.

III. Separability

Local rigidity

Proof

Fix real numbers $\epsilon_n > 0$ such that $\sum_{n \in \mathbb{N}} \epsilon_n < \infty$.

Let μ_c denote the counting measure on X .

Fix an increasing sequence of Borel sets $R_n \subseteq X \times X$ such that $E = \bigcup_{n \in \mathbb{N}} R_n$ and each vertical section of R_n has cardinality $\leq n$.

For each $n \in \mathbb{N}$, set $\nu_n = (\mu \times \mu_c) \upharpoonright R_n$.

III. Separability

Local rigidity

Proof

Fix real numbers $\epsilon_n > 0$ such that $\sum_{n \in \mathbb{N}} \epsilon_n < \infty$.

Let μ_c denote the counting measure on X .

Fix an increasing sequence of Borel sets $R_n \subseteq X \times X$ such that $E = \bigcup_{n \in \mathbb{N}} R_n$ and each vertical section of R_n has cardinality $\leq n$.

For each $n \in \mathbb{N}$, set $\nu_n = (\mu \times \mu_c) \upharpoonright R_n$.

Set $\nu = (\mu \times \mu_c) \upharpoonright E$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Fix countable dense sets $\mathcal{D}_n \subseteq L(R_n, \nu_n, \Gamma)$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Fix countable dense sets $\mathcal{D}_n \subseteq L(R_n, \nu_n, \Gamma)$.

Let \mathcal{D}'_n denote the set of $\rho \in \mathcal{D}_n$ for which there exist $\sigma \in L(E, \nu, \Gamma)$ and $\varphi \in \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ such that $\text{dom}(\sigma) = E \upharpoonright \text{dom}(\varphi)$, φ is σ -invariant, and $d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \rho) \leq \epsilon_n$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Fix countable dense sets $\mathcal{D}_n \subseteq L(R_n, \nu_n, \Gamma)$.

Let \mathcal{D}'_n denote the set of $\rho \in \mathcal{D}_n$ for which there exist $\sigma \in L(E, \nu, \Gamma)$ and $\varphi \in \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ such that $\text{dom}(\sigma) = E \upharpoonright \text{dom}(\varphi)$, φ is σ -invariant, and $d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \rho) \leq \epsilon_n$.

Fix such a $\sigma_{n,\rho}$ and $\varphi_{n,\rho}$ for each $n \in \mathbb{N}$ and $\rho \in \mathcal{D}'_n$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Fix countable dense sets $\mathcal{D}_n \subseteq L(R_n, \nu_n, \Gamma)$.

Let \mathcal{D}'_n denote the set of $\rho \in \mathcal{D}_n$ for which there exist $\sigma \in L(E, \nu, \Gamma)$ and $\varphi \in \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ such that $\text{dom}(\sigma) = E \upharpoonright \text{dom}(\varphi)$, φ is σ -invariant, and $d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \rho) \leq \epsilon_n$.

Fix such a $\sigma_{n,\rho}$ and $\varphi_{n,\rho}$ for each $n \in \mathbb{N}$ and $\rho \in \mathcal{D}'_n$.

We will show that the set $\Phi = \{\varphi_{n,\rho} \mid n \in \mathbb{N} \text{ and } \rho \in \mathcal{D}'_n\}$ is dense.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Suppose that $\epsilon > 0$ and $\varphi \in \text{Hom}_{\leq \mathbb{N}_0\text{-to-1}}(E, \mu, F)$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Suppose that $\epsilon > 0$ and $\varphi \in \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$.

We can assume that there exists $\sigma \in L(E, \nu, \Gamma)$ with the property that $\text{dom}(\sigma) = E \upharpoonright \text{dom}(\varphi)$ and φ is σ -invariant.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Suppose that $\epsilon > 0$ and $\varphi \in \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$.

We can assume that there exists $\sigma \in L(E, \nu, \Gamma)$ with the property that $\text{dom}(\sigma) = E \upharpoonright \text{dom}(\varphi)$ and φ is σ -invariant.

For $n \in \mathbb{N}$, fix $\rho_n \in \mathcal{D}_n$ such that $d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \rho_n) \leq \epsilon_n$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Suppose that $\epsilon > 0$ and $\varphi \in \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$.

We can assume that there exists $\sigma \in L(E, \nu, \Gamma)$ with the property that $\text{dom}(\sigma) = E \upharpoonright \text{dom}(\varphi)$ and φ is σ -invariant.

For $n \in \mathbb{N}$, fix $\rho_n \in \mathcal{D}_n$ such that $d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \rho_n) \leq \epsilon_n$.

Set $\sigma_n = \sigma_{n, \rho_n}$ and $\varphi_n = \varphi_{n, \rho_n}$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Suppose that $\epsilon > 0$ and $\varphi \in \text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$.

We can assume that there exists $\sigma \in L(E, \nu, \Gamma)$ with the property that $\text{dom}(\sigma) = E \upharpoonright \text{dom}(\varphi)$ and φ is σ -invariant.

For $n \in \mathbb{N}$, fix $\rho_n \in \mathcal{D}_n$ such that $d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \rho_n) \leq \epsilon_n$.

Set $\sigma_n = \sigma_{n, \rho_n}$ and $\varphi_n = \varphi_{n, \rho_n}$.

Note that $d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \sigma_n \upharpoonright (R_n \upharpoonright \text{dom}(\varphi_n))) \leq 2\epsilon_n$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

For each $n \in \mathbb{N}$, let E_n denote the equivalence relation generated by the set $D_n = \text{dom}(\sigma) \cap R_n \setminus D(\sigma, \sigma_n)$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

For each $n \in \mathbb{N}$, let E_n denote the equivalence relation generated by the set $D_n = \text{dom}(\sigma) \cap R_n \setminus D(\sigma, \sigma_n)$.

Also for each $n \in \mathbb{N}$, define $F_n = \bigcap_{m \geq n} E_m$ and

$$X_n = \{x \in \text{dom}(\varphi) \mid \exists y \in \text{dom}(\varphi) \cap (R_n)_x \sigma(x, y) \neq \sigma_n(x, y)\}.$$

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

For each $n \in \mathbb{N}$, let E_n denote the equivalence relation generated by the set $D_n = \text{dom}(\sigma) \cap R_n \setminus D(\sigma, \sigma_n)$.

Also for each $n \in \mathbb{N}$, define $F_n = \bigcap_{m \geq n} E_m$ and

$$X_n = \{x \in \text{dom}(\varphi) \mid \exists y \in \text{dom}(\varphi) \cap (R_n)_x \sigma(x, y) \neq \sigma_n(x, y)\}.$$

So $\mu(X_n) \leq d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \sigma_n \upharpoonright (R_n \upharpoonright \text{dom}(\varphi_n))) \leq 2\epsilon_n$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

For each $n \in \mathbb{N}$, let E_n denote the equivalence relation generated by the set $D_n = \text{dom}(\sigma) \cap R_n \setminus D(\sigma, \sigma_n)$.

Also for each $n \in \mathbb{N}$, define $F_n = \bigcap_{m \geq n} E_m$ and

$$X_n = \{x \in \text{dom}(\varphi) \mid \exists y \in \text{dom}(\varphi) \cap (R_n)_x \sigma(x, y) \neq \sigma_n(x, y)\}.$$

So $\mu(X_n) \leq d_{\nu_n}(\sigma \upharpoonright (R_n \upharpoonright \text{dom}(\varphi)), \sigma_n \upharpoonright (R_n \upharpoonright \text{dom}(\varphi_n))) \leq 2\epsilon_n$.

Thus the set $C = \sim \bigcap_{n \in \mathbb{N}} \bigcup_{m \geq n} X_m$ is μ -conull.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Note that $E \upharpoonright (C \cap \text{dom}(\varphi)) \subseteq \bigcup_{n \in \mathbb{N}} F_n$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Note that $E \upharpoonright (C \cap \text{dom}(\varphi)) \subseteq \bigcup_{n \in \mathbb{N}} F_n$.

Fix $n \in \mathbb{N}$ for which there is a Borel set $B \subseteq C \cap \text{dom}(\varphi)$ such that $\mu(\text{dom}(\varphi) \setminus B) \leq \epsilon$ and $F_n \upharpoonright B$ is $(\mu \upharpoonright B)$ -nowhere hyperfinite.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Note that $E \upharpoonright (C \cap \text{dom}(\varphi)) \subseteq \bigcup_{n \in \mathbb{N}} F_n$.

Fix $n \in \mathbb{N}$ for which there is a Borel set $B \subseteq C \cap \text{dom}(\varphi)$ such that $\mu(\text{dom}(\varphi) \setminus B) \leq \epsilon$ and $F_n \upharpoonright B$ is $(\mu \upharpoonright B)$ -nowhere hyperfinite.

Observe that both φ and φ_n are $(\sigma \upharpoonright (F_n \upharpoonright B))$ -invariant.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Note that $E \upharpoonright (C \cap \text{dom}(\varphi)) \subseteq \bigcup_{n \in \mathbb{N}} F_n$.

Fix $n \in \mathbb{N}$ for which there is a Borel set $B \subseteq C \cap \text{dom}(\varphi)$ such that $\mu(\text{dom}(\varphi) \setminus B) \leq \epsilon$ and $F_n \upharpoonright B$ is $(\mu \upharpoonright B)$ -nowhere hyperfinite.

Observe that both φ and φ_n are $(\sigma \upharpoonright (F_n \upharpoonright B))$ -invariant.

So local rigidity ensures that $\varphi \upharpoonright B = \varphi_n \upharpoonright B$.

III. Separability

Local rigidity

Proof of Proposition 4 (continued)

Note that $E \upharpoonright (C \cap \text{dom}(\varphi)) \subseteq \bigcup_{n \in \mathbb{N}} F_n$.

Fix $n \in \mathbb{N}$ for which there is a Borel set $B \subseteq C \cap \text{dom}(\varphi)$ such that $\mu(\text{dom}(\varphi) \setminus B) \leq \epsilon$ and $F_n \upharpoonright B$ is $(\mu \upharpoonright B)$ -nowhere hyperfinite.

Observe that both φ and φ_n are $(\sigma \upharpoonright (F_n \upharpoonright B))$ -invariant.

So local rigidity ensures that $\varphi \upharpoonright B = \varphi_n \upharpoonright B$.

Thus $d_\mu(\varphi, \varphi_n) \leq \epsilon$.

III. Separability

Local rigidity

Definition

We say that F has **separable homomorphisms** if whenever X is a Polish space, E is a countable Borel equivalence relation on X , and μ is a finite Borel measure on X for which E is μ -nowhere hyperfinite, the space $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ is separable.

III. Separability

Local rigidity

Definition

We say that F has **separable homomorphisms** if whenever X is a Polish space, E is a countable Borel equivalence relation on X , and μ is a finite Borel measure on X for which E is μ -nowhere hyperfinite, the space $\text{Hom}_{\leq \aleph_0\text{-to-1}}(E, \mu, F)$ is separable.

Theorem 5 (Conley-M)

The family of countable Borel equivalence relations on Polish spaces with separable homomorphisms is closed downward under countable-to-one Borel homomorphism, and includes every orbit equivalence relation of a locally rigid Borel action of a countable group.

Part IV

Borel reducibility

IV. Borel reducibility

Proof of Theorem 4 (continued)

Fix a Borel contraction $f: X \rightarrow B$ such that $\forall x \in X \ x E f(x)$.

Define $x E_r y \Leftrightarrow f(x) F_r f(y)$.

Then for no distinct $r, s \in \mathbb{R}$ is there a μ -positive set on which E_r and E_s agree. ☒

IV. Borel reducibility

Increasing sequences

Theorem 5

Suppose that X is a Polish space, E is a countable treeable Borel equivalence relation on X with separable homomorphisms, and μ is a finite Borel measure on X such that E is μ -nowhere hyperfinite. Then there is an increasing sequence $(E_r)_{r \in \mathbb{R}}$ of Borel subequivalence relations of E such that for no distinct $r, s \in \mathbb{R}$ is there a μ -measurable reduction of E_r to E_s on a μ -positive set.

IV. Borel reducibility

Increasing sequences

Proof

Fix an increasing sequence $(E_r)_{r \in \mathbb{R}}$ of μ -nowhere hyperfinite Borel subequivalence relations of E such that for no distinct $r, s \in \mathbb{R}$ is there a μ -positive set on which E_r and E_s agree.

IV. Borel reducibility

Increasing sequences

Proof

Fix an increasing sequence $(E_r)_{r \in \mathbb{R}}$ of μ -nowhere hyperfinite Borel subequivalence relations of E such that for no distinct $r, s \in \mathbb{R}$ is there a μ -positive set on which E_r and E_s agree.

We can assume that $\bigcap_{r \in \mathbb{R}} E_r$ is μ -nowhere hyperfinite on B .

IV. Borel reducibility

Increasing sequences

Proof of Theorem 5 (continued)

Then for each $r \in \mathbb{R}$, there are only countably many $s \in \mathbb{R}$ for which there is a μ -measurable reduction of E_s to E_r on a μ -positive set.

IV. Borel reducibility

Increasing sequences

Proof of Theorem 5 (continued)

Then for each $r \in \mathbb{R}$, there are only countably many $s \in \mathbb{R}$ for which there is a μ -measurable reduction of E_s to E_r on a μ -positive set.

So we can assume that for no distinct $r, s \in \mathbb{R}$ is there a μ -measurable reduction of E_r to E_s on a μ -positive set. \square

IV. Borel reducibility

Cardinality of bases

Theorem 6

Suppose that X is a Polish space and E is a countable treeable Borel equivalence relation on X which has separable homomorphisms but is not measure hyperfinite. Then there is no basis of cardinality strictly less than $\text{add}(\text{null})$ for the family of non-measure hyperfinite countable Borel equivalence relations which admit countable-to-one Borel homomorphisms to E .

IV. Borel reducibility

Cardinality of bases

Proof

Fix a finite Borel measure μ for which E is μ -nowhere hyperfinite.

IV. Borel reducibility

Cardinality of bases

Proof

Fix a finite Borel measure μ for which E is μ -nowhere hyperfinite.

Fix a sequence $(E_r)_{r \in \mathbb{R}}$ of Borel subequivalence relations of E such that for no distinct $r, s \in \mathbb{R}$ is there a μ -measurable reduction of E_r to E_s on a μ -positive set.

IV. Borel reducibility

Cardinality of bases

Proof of Theorem 6 (continued)

Suppose that \mathcal{F} is a basis of cardinality $< \text{add}(\text{null})$.

IV. Borel reducibility

Cardinality of bases

Proof of Theorem 6 (continued)

Suppose that \mathcal{F} is a basis of cardinality $< \text{add}(\text{null})$.

For each $F \in \mathcal{F}$, fix a finite Borel measure μ_F such that F is μ_F -nowhere hyperfinite.

IV. Borel reducibility

Cardinality of bases

Proof of Theorem 6 (continued)

Suppose that \mathcal{F} is a basis of cardinality $< \text{add}(\text{null})$.

For each $F \in \mathcal{F}$, fix a finite Borel measure μ_F such that F is μ_F -nowhere hyperfinite.

We can assume that every μ_F -measurable reduction of F to E_r sends μ_F -positive sets to μ -positive sets.

IV. Borel reducibility

Cardinality of bases

Proof of Theorem 6 (continued)

Fix $F_r \in \mathcal{F}$ and μ -measurable reductions φ_r of F_r to E_r .

IV. Borel reducibility

Cardinality of bases

Proof of Theorem 6 (continued)

Fix $F_r \in \mathcal{F}$ and μ -measurable reductions φ_r of F_r to E_r .

Fix distinct $r, s \in \mathbb{R}$ such that $F_r = F_s$ and φ_r and φ_s agree on a μ_{F_r} -positive set.

IV. Borel reducibility

Cardinality of bases

Proof of Theorem 6 (continued)

Fix $F_r \in \mathcal{F}$ and μ -measurable reductions φ_r of F_r to E_r .

Fix distinct $r, s \in \mathbb{R}$ such that $F_r = F_s$ and φ_r and φ_s agree on a μ_{F_r} -positive set.

Then E_r and E_s agree on a μ -positive set. ☒

IV. Borel reducibility

Complexity

Theorem 7

Suppose that X is a Polish space and E is a countable treeable Borel equivalence relation on X which has separable homomorphisms but is not measure hyperfinite. Then the initial segment of the Borel reducibility hierarchy consisting of relations with countable-to-one Borel homomorphisms to $E \times \Delta(\mathbb{R})$ contains copies of all Borel quasi-orders on Polish spaces.

IV. Borel reducibility

Complexity

Proof

Fix a finite Borel measure μ for which E is μ -nowhere hyperfinite.

IV. Borel reducibility

Complexity

Proof

Fix a finite Borel measure μ for which E is μ -nowhere hyperfinite.

Fix a sequence $(E_r)_{r \in \mathbb{R}}$ of Borel subequivalence relations of E such that for no distinct $r, s \in \mathbb{R}$ is there a μ -measurable reduction of E_r to E_s on a μ -positive set.

IV. Borel reducibility

Complexity

Proof of Theorem 7 (continued)

We can assume there are finite Borel measures μ_r such that every E_r -invariant Borel set is μ_r -null or μ_r -conull, and for no distinct $r, s \in \mathbb{R}$ is there a μ_r -measurable reduction of E_r to E_s on a μ_r -positive set.

IV. Borel reducibility

Complexity

Proof of Theorem 7 (continued)

We can assume there are finite Borel measures μ_r such that every E_r -invariant Borel set is μ_r -null or μ_r -conull, and for no distinct $r, s \in \mathbb{R}$ is there a μ_r -measurable reduction of E_r to E_s on a μ_r -positive set.

Associate with each Borel set $B \subseteq \mathbb{R}$ the disjoint union of the equivalence relations E_r , for $r \in B$.

IV. Borel reducibility

Complexity

Proof of Theorem 7 (continued)

We can assume there are finite Borel measures μ_r such that every E_r -invariant Borel set is μ_r -null or μ_r -conull, and for no distinct $r, s \in \mathbb{R}$ is there a μ_r -measurable reduction of E_r to E_s on a μ_r -positive set.

Associate with each Borel set $B \subseteq \mathbb{R}$ the disjoint union of the equivalence relations E_r , for $r \in B$.

This reduces \subseteq on Borel sets to Borel reducibility. ☒
