

The multiplicative Schwarz method for matrices with a special block structure

Petr Tichý

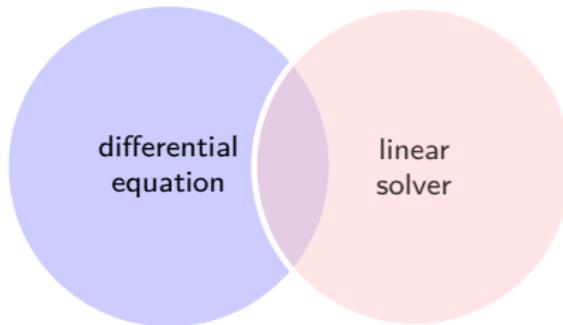

joint work with

Carlos Echeverría, Jörg Liesen, Daniel Szyld

PANM20, June 24 - 29, 2020, Hejnice

Motivation

$$-\varepsilon u'' + \alpha u' + \beta u = f$$

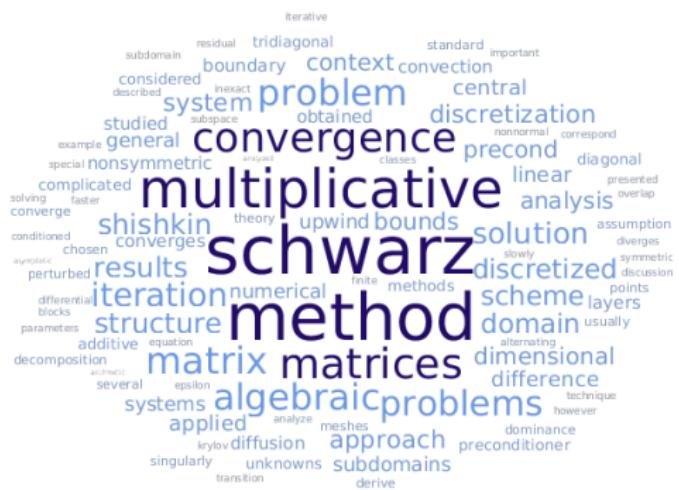

Shishkin mesh

$$\mathcal{A}x = b$$

Related papers

- **C. Echeverría, J. Liesen, P. Tichý, D. Szyld**, Convergence of the multiplicative Schwarz method for singularly perturbed convection-diffusion problems discretized on a Shishkin mesh, Electron. Trans. Numer. Anal., 2018.

One-dimensional case

$$-\varepsilon u'' + \alpha u' + \beta u = f$$

$$0 < \varepsilon \ll \alpha$$

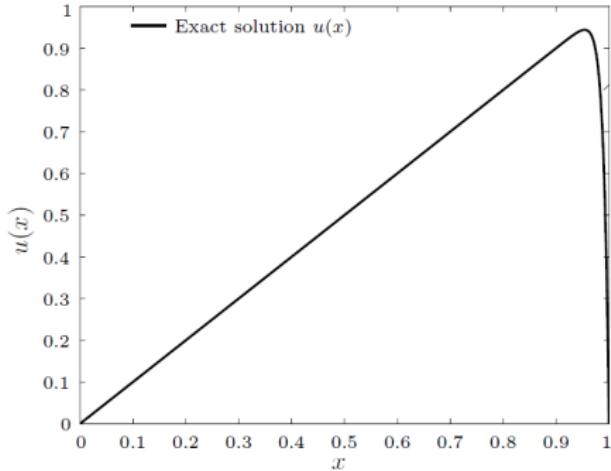

Convection-diffusion boundary value problem

$$-\varepsilon u'' + \alpha u' + \beta u = f$$

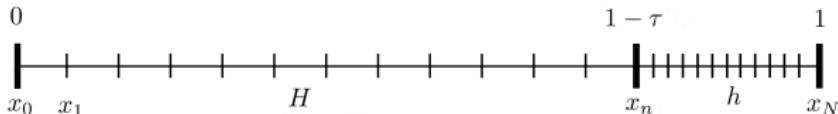

Convection-diffusion boundary value problem

$$-\varepsilon u'' + \alpha u' + \beta u = f$$

Shishkin mesh \rightarrow uniform convergence

The standard upwind difference scheme

$$\mathcal{A} = \begin{bmatrix} & & \\ & A_H & \\ & | & | \\ & b_H & \\ \hline & c & a & b \\ \hline & & c_h & \\ & & & A_h \end{bmatrix}$$

The standard upwind difference scheme

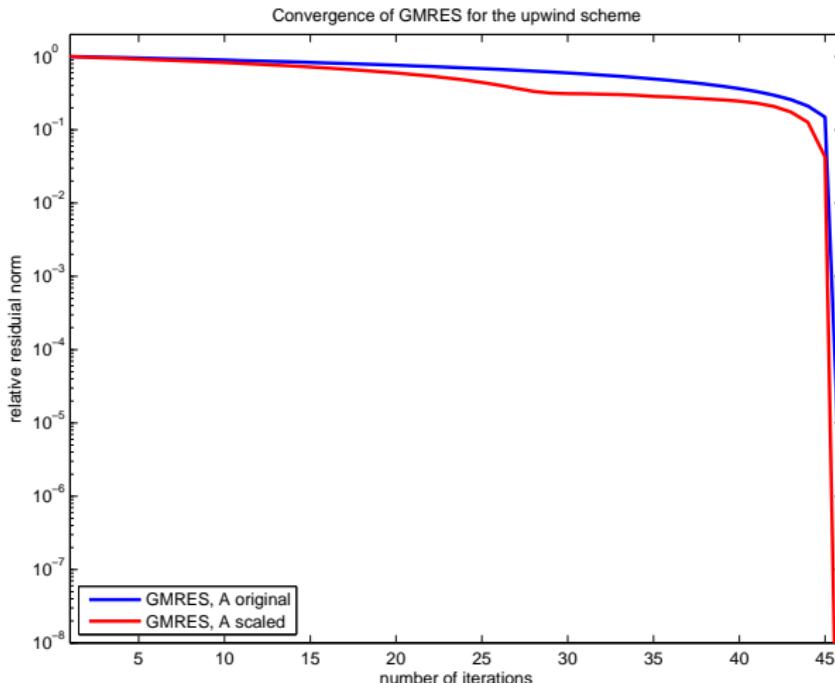

$$\mathcal{A} = \begin{bmatrix} & & \\ A_H & | & | & | \\ \hline & b_H & & \\ \hline c & a & b & \\ \hline & c_h & & \\ & & & A_h \end{bmatrix}$$

nonsymmetric M-matrix

$$\mathcal{A} = Y\Lambda Y^{-1}$$

$\varepsilon = 10^{-8}$	original	scaled
$\kappa(\mathcal{A})$	10^{10}	10^3
$\kappa(Y)$	10^{17}	10^{19}

Solving linear system using GMRES

Linear solver and geometry of the problem

$$\mathcal{A} = \left[\begin{array}{c|c|c} A_H & b_H & \\ \hline c & a & b \\ \hline & c_h & A_h \end{array} \right]$$

- Systems with submatrices easily solvable (Toeplitz).
- Restriction operators $R_1 = \begin{bmatrix} I_n & 0 \end{bmatrix}$, $R_2 = \begin{bmatrix} 0 & I_n \end{bmatrix}$.

Multiplicative Schwarz method

- Given $x^{(k)}$, then $x = x^{(k)} + y$ and y satisfies

$$Ay = b - Ax^{(k)} \equiv r^{(k)}.$$

Multiplicative Schwarz method

- Given $x^{(k)}$, then $x = x^{(k)} + y$ and y satisfies

$$Ay = b - Ax^{(k)} \equiv r^{(k)}.$$

- Restriction** to the **first domain**

$$(R_1 A R_1^T) y_1 = R_1 r^{(k)}$$

and use **prolongation** of y_1 ,

$$x^{(k+\frac{1}{2})} = x^{(k)} + R_1^T y_1.$$

Multiplicative Schwarz method

- Given $x^{(k)}$, then $x = x^{(k)} + y$ and y satisfies

$$Ay = b - Ax^{(k)} \equiv r^{(k)}.$$

- Restriction** to the **first domain**

$$(R_1 A R_1^T) y_1 = R_1 r^{(k)}$$

and use **prolongation** of y_1 ,

$$x^{(k+\frac{1}{2})} = x^{(k)} + R_1^T y_1.$$

- Use $x^{(k+\frac{1}{2})}$ and restrict to the **second domain**

$$x^{(k+1)} = x^{(k+\frac{1}{2})} + R_2^T y_2.$$

Multiplicative Schwarz method

results [Echeverría, Liesen, Tichý, Szyld, 2018]

- Consistent stationary method

$$x^{(k)} = \overbrace{(I - P_2)(I - P_1)}^T x^{(k-1)} + v$$

Multiplicative Schwarz method

results [Echeverría, Liesen, Tichý, Szyld, 2018]

- Consistent stationary method

$$\begin{aligned}x^{(k)} &= \overbrace{(I - P_2)(I - P_1)}^T x^{(k-1)} + v \\&\quad \downarrow \\x - x^{(k)} &= T^k (x - x^{(0)})\end{aligned}$$

Multiplicative Schwarz method

results [Echeverría, Liesen, Tichý, Szyld, 2018]

- Consistent stationary method

$$\begin{aligned} x^{(k)} &= \overbrace{(I - P_2)(I - P_1)}^T x^{(k-1)} + v \\ &\quad \downarrow \\ x - x^{(k)} &= T^k (x - x^{(0)}) \end{aligned}$$

- Bounds

$$\|x - x^{(k)}\| \leq \|\textcolor{red}{T^k}\| \|x - x^{(0)}\| \leq \|T\|^k \|x - x^{(0)}\|$$

Multiplicative Schwarz method

results [Echeverría, Liesen, Tichý, Szyld, 2018]

- Consistent stationary method

$$\begin{aligned} x^{(k)} &= \overbrace{(I - P_2)(I - P_1)}^T x^{(k-1)} + v \\ &\quad \downarrow \\ x - x^{(k)} &= T^k (x - x^{(0)}) \end{aligned}$$

- Bounds

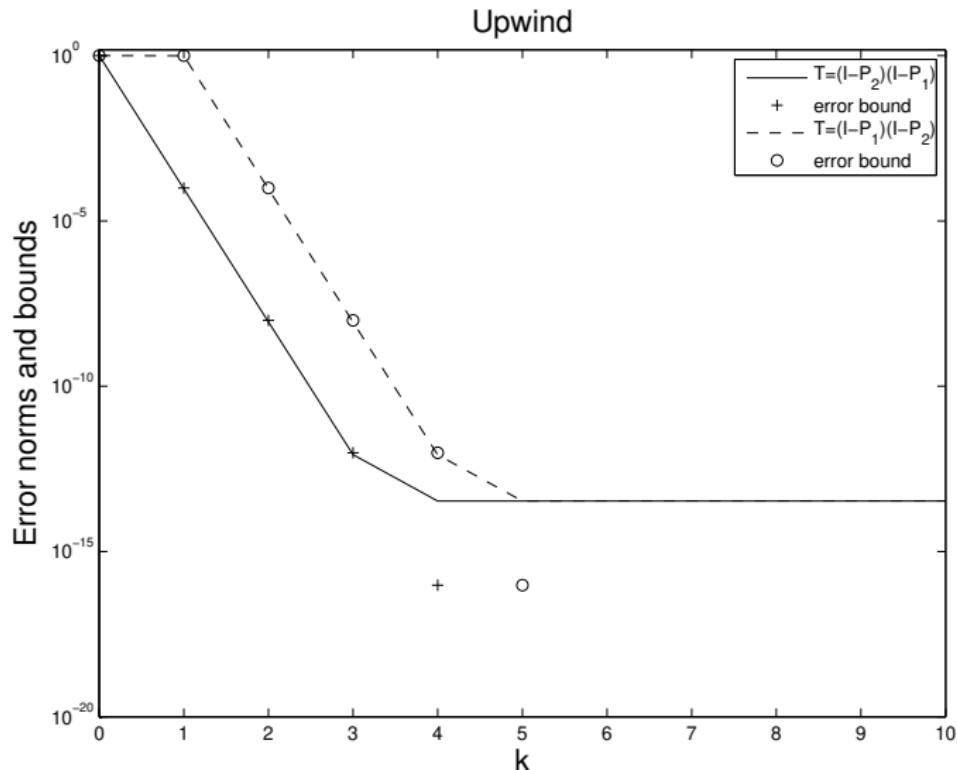

$$\|x - x^{(k)}\| \leq \|T^k\| \|x - x^{(0)}\| \leq \|T\|^k \|x - x^{(0)}\|$$

- We have shown

$$\|T^k\|_\infty = \rho^k \quad \text{and} \quad \rho < \frac{\varepsilon}{\varepsilon + \frac{\alpha}{N}}$$

Numerical example

$$\varepsilon = 10^{-6}, N = 200, \alpha = 1, \beta = 0$$

Schwarz method as a preconditioner

- Consistent scheme

$$x^{(k+1)} = T x^{(k)} + v$$

- **Preconditioned** system

$$(I - T)x = v$$

Schwarz method as a preconditioner

- Consistent scheme

$$x^{(k+1)} = T x^{(k)} + v$$

- **Preconditioned** system

$$(I - T)x = v$$

- T is a **rank-one** matrix, therefore

$$\dim (\mathcal{K}_k(I - T, r_0)) \leq 2$$

\Rightarrow GMRES converges in **at most 2 steps**

Schwarz method as a preconditioner

- Consistent scheme

$$x^{(k+1)} = T x^{(k)} + v$$

- **Preconditioned** system

$$(I - T)x = v$$

- T is a **rank-one** matrix, therefore

$$\dim (\mathcal{K}_k(I - T, r_0)) \leq 2$$

\Rightarrow GMRES converges in **at most 2 steps**

... a **motivation** for more dimensional cases.

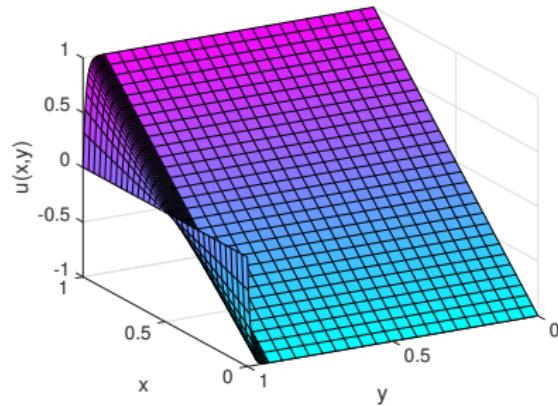

Two-dimensional case

[Echeverría, Liesen, Tichý, 2020]

A motivation

Problems with **one** boundary layer

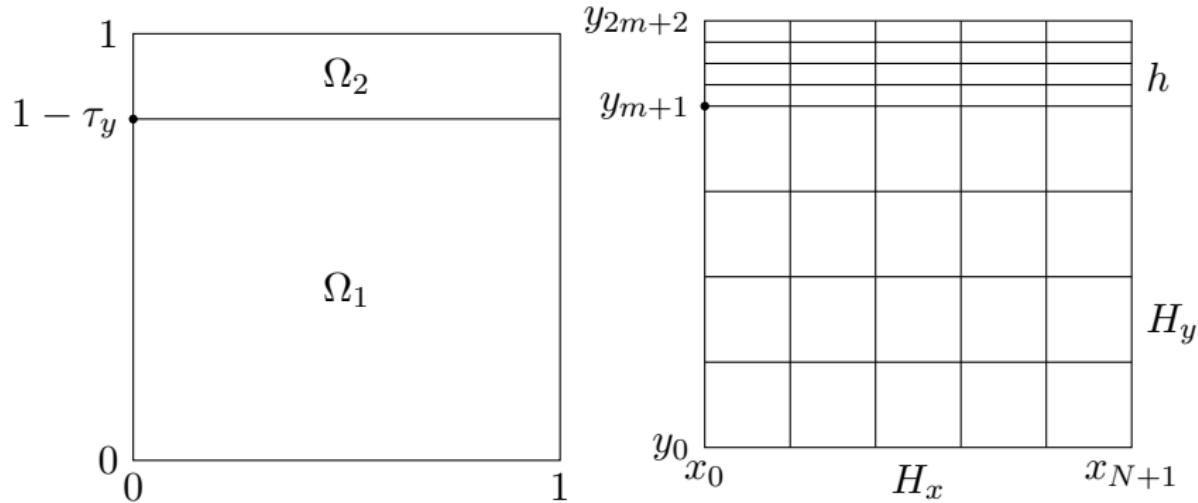

$$-\varepsilon \Delta u + \alpha u_y + \beta u = f$$

E.g., $\alpha = 1$, $\beta = 0$, $f = 0$,

$$u(x, y) = (2x - 1) \left(\frac{1 - e^{(y-1)/\varepsilon}}{1 - e^{-1/\varepsilon}} \right).$$

Shishkin mesh

Use the standard upwind difference scheme.

A general algebraic problem

$$\mathcal{A} = \left[\begin{array}{c|c|c} \hat{A}_H & & \\ \hline C & B_H & \\ \hline & A & B \\ \hline & C_h & \hat{A}_h \end{array} \right] \in \mathbb{R}^{N(2m+1) \times N(2m+1)}$$

A general algebraic problem

$$\mathcal{A} = \left[\begin{array}{c|c|c} \widehat{A}_H & & \\ \hline C & B_H & \\ \hline & A & B \\ \hline & C_h & \widehat{A}_h \end{array} \right] \in \mathbb{R}^{N(2m+1) \times N(2m+1)}$$

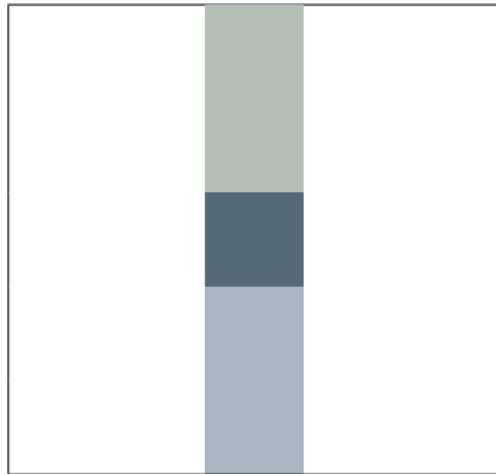

- Multiplicative Schwarz method

$$x^{(k)} = T x^{(k-1)} + v$$

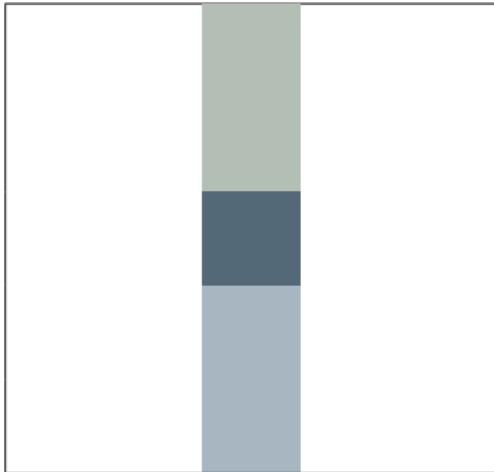

- **Structure** of T , **convergence** ?

$$\|x - x^{(k)}\| \leq \|T^k\| \|x - x^{(0)}\|$$

Structure of T

Structure of T

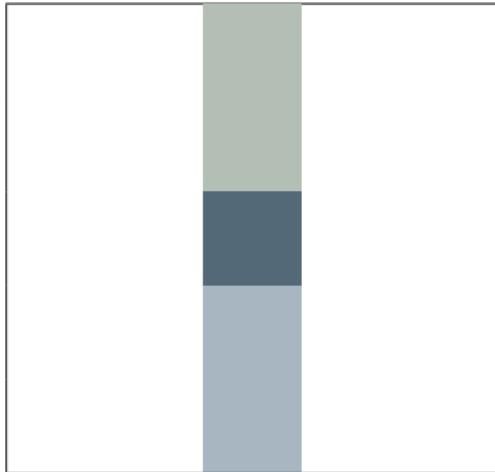

$$T = (I - P_2)(I - P_1)$$

$$\|T^{k+1}\| \leq \rho^k \|T\|$$

$$\rho = \|\textcolor{red}{Z}_{11}^{(h)} \textcolor{blue}{C}_h \Pi^{(2)} \textcolor{red}{Z}_{mm}^{(H)} \textcolor{blue}{B}_H \Pi^{(1)}\|$$

Structure of T

$$T = (I - P_2)(I - P_1)$$

$$\|T^{k+1}\| \leq \rho^k \|T\|$$

$$\rho = \|\textcolor{red}{Z}_{11}^{(h)} \textcolor{blue}{C}_h \Pi^{(2)} \textcolor{red}{Z}_{mm}^{(H)} \textcolor{blue}{B}_H \Pi^{(1)}\|$$

$$\widehat{\boldsymbol{A}}_{\mathbf{h}}^{-1} = [\boldsymbol{Z}_{ij}^{(h)}], \quad \boldsymbol{\Pi}^{(2)} = \left(\textcolor{blue}{A} - \boldsymbol{B} \textcolor{red}{Z}_{11}^{(h)} \textcolor{blue}{C}_h\right)^{-1} \textcolor{blue}{C}$$

How to bound **norms of blocks** of inverses of $\widehat{\boldsymbol{A}}_{\mathbf{h}}$ and $\widehat{\boldsymbol{A}}_H$?

Block tridiagonal case

New results of [Echeverría, Liesen, Nabben, 2018]

$$\hat{A}_h = \begin{bmatrix} A_h & B_h & & \\ C_h & \ddots & \ddots & \\ & \ddots & \ddots & B_h \\ & & C_h & A_h \end{bmatrix}, \quad \hat{A}_H = \dots$$

\hat{A}_h is **row block diagonally dominant** if

$$\|A_h^{-1}B_h\| + \|A_h^{-1}C_h\| \leq 1$$

How to bound $\|Z_{ij}^{(h)}\|?$

[Echeverría, Liesen, Nabben, 2018]

Bounding ρ for \mathcal{A} **row and column** block **diagonally dominant**

Using [Echeverría, Liesen, Nabben, 2018] we have shown

$$\rho \leq \frac{\eta_h \|A^{-1}C\|}{1 - \eta_h \|A^{-1}B\|} \frac{\eta_H \|A^{-1}B\|}{1 - \eta_H \|A^{-1}C\|}$$

where $\|\cdot\|$ is any induced matrix norm and

$$\eta_h = \min \left\{ \frac{\|A_h^{-1}C_h\|}{1 - \|A_h^{-1}B_h\|}, \frac{\|A_h^{-1}\| \|C_h\|}{1 - \|C_h A_h^{-1}\|} \right\}$$

Bounds now contain only inverses of **individual blocks**.

Bounding ρ

for \mathcal{A} **row and column** block **diagonally dominant**

Using [Echeverría, Liesen, Nabben, 2018] we have shown

$$\rho \leq \frac{\eta_h \|A^{-1}C\|}{1 - \eta_h \|A^{-1}B\|} \frac{\eta_H \|A^{-1}B\|}{1 - \eta_H \|A^{-1}C\|}$$

where $\|\cdot\|$ is any induced matrix norm and

$$\eta_h = \min \left\{ \frac{\|A_h^{-1}C_h\|}{1 - \|A_h^{-1}B_h\|}, \frac{\|A_h^{-1}\| \|C_h\|}{1 - \|C_h A_h^{-1}\|} \right\}$$

Bounds now contain only inverses of **individual blocks**.

$$\|x - x^{(k)}\| \leq \rho^k \|\mathcal{T}\| \|x - x^{(0)}\|.$$

Application to the convection-diffusion equation

Discretization on the Shishkin mesh

$$-\varepsilon \Delta u + \alpha u_y + \beta u = f$$

$$\mathcal{A} = \left[\begin{array}{cc|c|c} A_H & B_H & & \\ C_H & \ddots & \ddots & \\ & \ddots & \ddots & B_H \\ & C_H & A_H & B_H \\ \hline & C & A & B \\ \hline & C_h & A_h & B_h \\ & & C_h & \ddots & \ddots \\ & & & \ddots & \ddots & B_h \\ & & & C_h & A_h & \end{array} \right]$$

- $C_H, C, C_h, B_H, B, B_h, \dots$ scalar multiples of I
 $A_H, A, A_h \dots$ tridiagonal and Toeplitz
 $\mathcal{A} \dots$ row and column block diagonally dominant

Application to the convection-diffusion equation

discretized on the Shishkin mesh

In [Echeverría, Liesen, Tichý, 2020] we have shown for $\|\cdot\| = \|\cdot\|_\infty$ that

$$\|x - x^{(k+1)}\| \leq \rho^k \|\mathcal{T}\| \|x - x^{(0)}\|$$

where

$$\rho < \frac{\varepsilon}{\varepsilon + \frac{\alpha}{m}}$$

and

$$\|\mathcal{T}\| \leq \rho \quad \text{or} \quad \|\mathcal{T}\| \leq 1,$$

depending on the order of domains in the definition of T .

Application to the convection-diffusion equation

discretized on the Shishkin mesh

In [Echeverría, Liesen, Tichý, 2020] we have shown for $\|\cdot\| = \|\cdot\|_\infty$ that

$$\|x - x^{(k+1)}\| \leq \rho^k \|\mathcal{T}\| \|x - x^{(0)}\|$$

where

$$\rho < \frac{\varepsilon}{\varepsilon + \frac{\alpha}{m}}$$

and

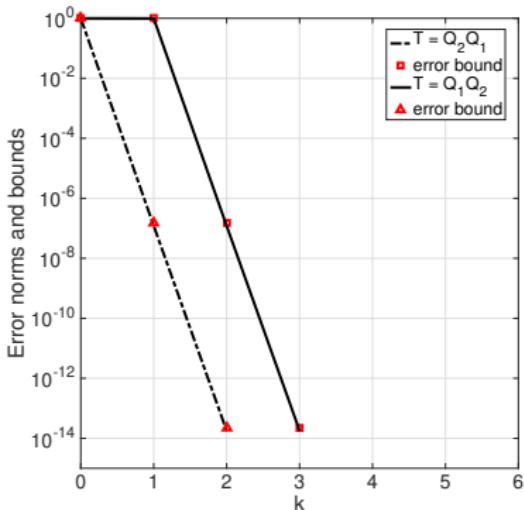

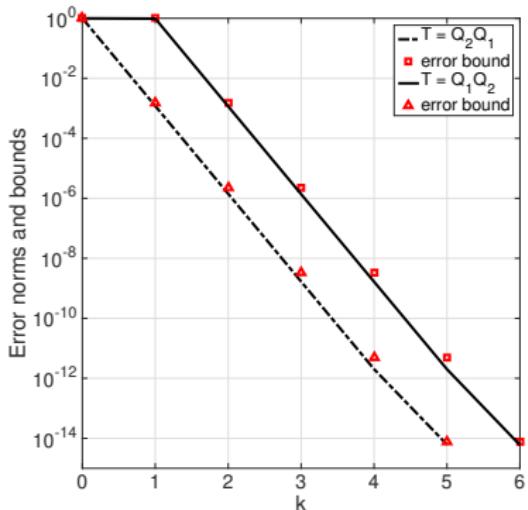

$$\|\mathcal{T}\| \leq \rho \quad \text{or} \quad \|\mathcal{T}\| \leq 1,$$

depending on the order of domains in the definition of T .

- Low-rank structure of T
- Schwarz as a preconditioner
- Preconditioned GMRES \rightarrow at most $N + 1$ iterations

Tightness of the bound

$$N = 30, \quad m = 20, \quad \mathcal{A} \in \mathbb{R}^{1230 \times 1230}, \quad \alpha = 1, \quad \beta = 0$$

Convergence of multiplicative Schwarz and error bounds
for $\varepsilon = 10^{-4}$ (left) and $\varepsilon = 10^{-8}$ (right)

Open problems

Practical implementation issues

To use the iterative scheme

$$x^{(k)} = T x^{(k-1)} + v$$

we need to solve **linear systems with submatrices** of

$$\left[\begin{array}{c|c|c} \widehat{A}_H & & \\ \hline & B_H & \\ \hline C & A & B \\ \hline & C_h & \widehat{A}_h \end{array} \right]$$

- Schur complement and fast Toeplitz solvers?
- Inexact solvers?
- Problems with non-constant coefficients?

Additive Schwarz method

$$x^{(k)} = Tx^{(k-1)} + w, \quad T \equiv I - (P_1 + P_2)$$

where

$$T = - \begin{bmatrix} 0_{N(m-1)} & P_{1:m-1}^{(1)} \\ \Pi^{(2)} & \textcolor{red}{I_N} & P_m^{(1)} \\ P_1^{(2)} & P_{2:m}^{(2)} & 0_{N(m-1)} \end{bmatrix}.$$

Additive Schwarz method

$$x^{(k)} = Tx^{(k-1)} + w, \quad T \equiv I - (P_1 + P_2)$$

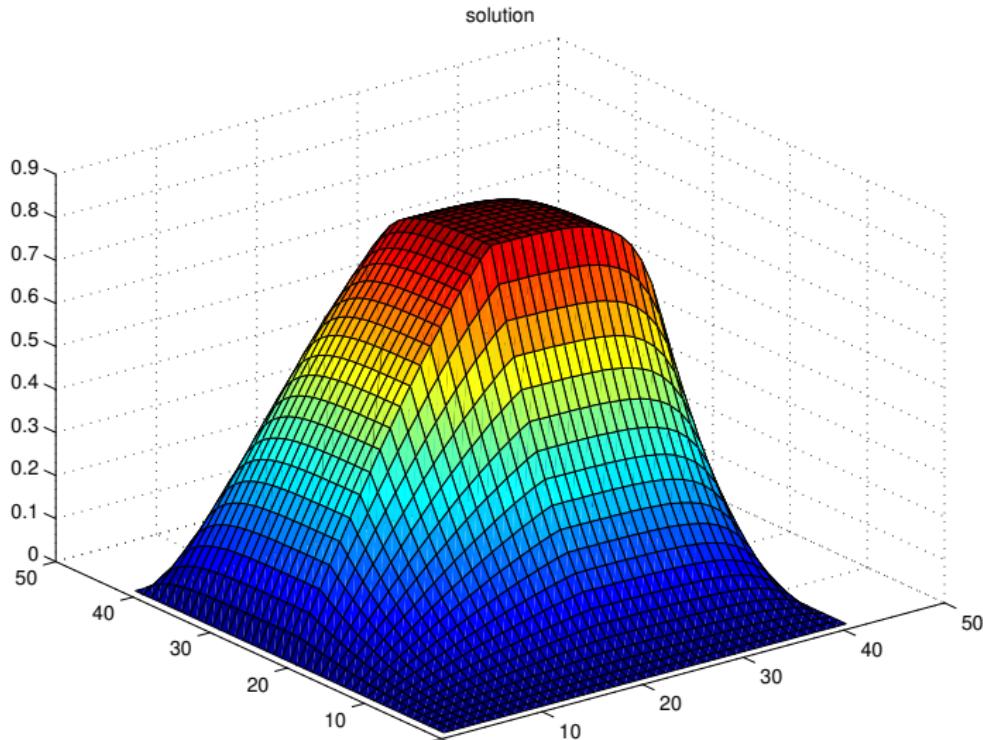

where

$$T = - \begin{bmatrix} 0_{N(m-1)} & P_{1:m-1}^{(1)} \\ \Pi^{(2)} & \textcolor{red}{I_N} & P_m^{(1)} \\ P_1^{(2)} & P_{2:m}^{(2)} & 0_{N(m-1)} \end{bmatrix}.$$

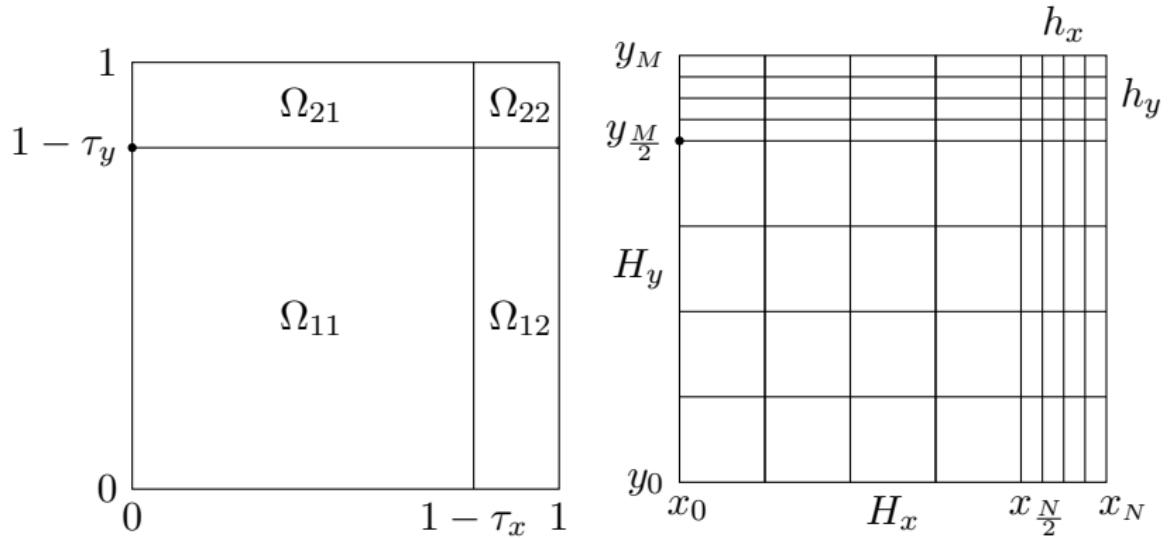

- $\rho(T) \geq 1$
- $I - T$ is nonsingular
- can be used as a preconditioner

Two boundary layers

$$-\varepsilon \Delta u + \alpha_1 u_x + \alpha_2 u_y + \beta u = f$$

Shishkin mesh
